

New Product Release February 2015

Screening Septage is not the only thing the Beast can do!

The Beast just completed its second extremely successful pilot test, this time on RAS, Primary Sludge and Scum at a large Tennessee facility.

Any plant that does not have headworks screening or has inadequate headworks screening, is dealing with the same problem as this plant – sludge and lots of it. The Beast processed over 500 gpm of RAS and Primary Sludge with a 6 mm screen opening. It removed more than a ton of solids every day.

A few weeks earlier, the same Beast pilot unit spent a month at a large, treatment facility in Virginia screening FOG. The Beast did not discriminate on the type of grease. It took everything that came in, processing 350,000 gallons during the four week test with no special provisions for wash down and no blinding.

Everyone who witnessed the two pilot tests were most impressive with the fact that the Beast required no rock traps, no grinders, no hot water, no high pressure wash water and no solvents.
